What is MEEwallet™?

MEEwallet is a digital wallet where you can store all your payment and loyalty cards, just as you do with your physical wallet today.

MEEwallet can be used when shopping in stores and on the Internet with payment and loyalty cards enrolled by the user.

MEEwallet uses Bluetooth technology and a multifactor authorisation protocol enabling faster and safer payments for you and your customers.

Any information exchanged is tokenised, that is, all card, user, store/merchant and payment information have unique identifiers. Third parties cannot intercept sensitive or financial information.

Merchants in Denmark and internationally can use MEEwallet. Our solution is future proof and will support all future payment, gift, and loyalty cards.

Today, MEEwallet can be downloaded at the App Store and Google Play for iPhones and Android phones. Windows phones will be supported later this year.

MEEwallet supports VISA, VISA/Dankort, MasterCard, Forbrugsforenings (loyalty) card and the prepaid solution Bceptify. Further payment and loyalty solutions will be added continually.

How can customers use MEEwallet™ in a store?

To receive payments from customers' MEEwallet, the merchant requires a communication terminal (payment terminal), the MEEgg. The MEEgg is simple and fast to connect with the existing cash register.

- Customers shop as usual
- Shop assistants tap the MEE button on the cash register or use a stand-alone keyboard to enter the purchase amount
- During the payment session, the customer opens his/her MEEwallet App and taps "Pay"
- MEEgg and MEEwallet communicate via Bluetooth
- The customer verifies the amount, selects payment method and approves the purchase by entering a pre-selected PIN
- Acquirer (e.g. the bank) validates the transaction and payments are generated
- For each successful or unsuccessful payment, the customer receives an electronic receipt stored in the App and by email. The store receives a copy of the receipt.
- The store/merchant has access to daily transaction and reconciliation reports

Security for Merchants

At MEEwallet we think security first in everything we do. We are convinced that security is key for both merchants and customers.

Tokenisation

Our solution is based on a multi factor security protocol, which encrypts (tokenises) all data. All payment methods are encrypted upon enrolment in MEEwallet. In other words, if the customer's phone is stolen, no information regarding enrolled payment methods can be obtained.

Authorisation

During a transaction session, all exchanged communication is encrypted simultaneously and it is not possible to tamper the communication channels. When activating MEEwallet, the user creates a unique and private PIN to administer all actions within the wallet

Fast and secure payments

Merchants accepting payment transactions with MEEwallet obtain fast, reliable and secure transactions. Transactions are processed within seconds, reducing overall transaction time compared to other solutions available in the market. The solution is secure and cannot be compromised.

MEEgg uses Bluetooth technology, which makes it compatible with most mobile phones. Using Bluetooth technology implies that we can adjust the range to the Point of Sales in the store. Flexible ranging is adaptable to your requirements and provides both sales personnel and customers an improved user experience

Getting Started as a Merchant

In Denmark our payment terminal, MEEgg, can be acquired from our Danish merchant website www.meedkk.com, by contacting our sales department at sales@meewallet.com or contacting one of our sales representatives. For more information on prices and point of sales, please visit our website.

Step guide to getting started

1. Contact sales@meewallet.com
2. Terms of Agreement for purchase of MEEgg
3. Sign agreements with Acquirers for selected payment methods
 - follow general approval process with Acquirers
4. Delivery and installation of MEEgg

Estimated processing time is 48 hours from signed contracts to delivery

- Plug-in the MEEgg
- Connect to Internet
- Create connectivity between cash register and MEEgg
- You are now ready to accept payments from customers using MEEwallet
